ITEM 434

FLOWABLE FILL

434.1 Description. This Item shall govern for flowable fill to be used as backfill for construction of underground utilities, as called for on the drawings, or in other parts of the specifications. This material may be used in lieu of cement stabilized sand, at the option of the Engineer. Because of the time required for "setting up", this material can only be used at locations where the trench can be left open for approximately twelve hours prior to backfilling. Shoring for excavations and trenches shall meet the requirements of the latest edition of OSHA Regulation 1926, Subpart P.

434.2 Materials. Cement shall be Type I portland cement conforming to ASTM C150 “Standard Specification for Portland Cement.”

Fly ash shall meet the requirements of ASTM C618 “Standard Specification for Coal Fly Ash and Raw or Calcined Natural Pozzolan for Use in Concrete”, Class C. Fly ash shall have a minimum CaO content of 20 percent.

Sand shall be clean, durable sand containing not more than the following:

A. Deleterious Materials

1. Clay lumps, when tested in accordance with ASTM C142 “Standard Test Method for Clay Lumps and Friable Particles in Aggregates”, shall be less than 0.5 percent.

2. Lightweight pieces, when tested in accordance with ASTM C123 “Standard Test Method for Lightweight Particles in Aggregate”, shall be less than 5.0 percent.

3. Organic impurities, when tested in accordance with ASTM C40 “Standard Test Method for Organic Impurities in Fine Aggregates for Concrete”, shall not show a color darker than the standard color.

B. The plasticity index shall be 6 or less when tested in accordance with ASTM D4318 “Standard Test Methods for Liquid Limit, Plastic Limit, and Plasticity Index of Soils.”

C. Sand shall be free of organic matter and deleterious substances and shall meet the following gradation requirement:
Note: It is intended that the sand be a fine sand that will stay in suspension, in the mixture, to the extent required to obtain a flowable consistency. The gradation shall be adjusted to achieve this consistency.

Water shall be clean and clear, free of oils, acids, alkalis, organic matter, or other deleterious substances and shall conform to the requirements of ASTM C1602 “Standard Specification for Mixing Water Used in the Production of Hydraulic Cement Concrete.”

Admixtures shall conform to ASTM C1017 “Standard Specification for Chemical Admixtures for Use in Producing Flowing Concrete” and/or ASTM C494 “Standard Specification for Chemical Admixtures for Concrete.”

434.3 Mix Design. The following are given as typical mix designs for trial mixes. Adjustments of the proportions may be made to achieve proper solid suspension and optimum flowability. Admixtures may be used, if desired, to improve the characteristics of the mix. The suggested quantities of dry material per cubic yard are as follows:

<table>
<thead>
<tr>
<th>TRIAL MIX No. 1</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Cement</td>
<td>100 lbs.</td>
</tr>
<tr>
<td>Fly Ash</td>
<td>250 lbs.</td>
</tr>
<tr>
<td>Sand</td>
<td>2800 lbs.</td>
</tr>
<tr>
<td>Water</td>
<td>(approx.) 60 gals</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>TRIAL MIX No. 2</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Cement</td>
<td>100 lbs.</td>
</tr>
<tr>
<td>Fly Ash</td>
<td>300 lbs.</td>
</tr>
<tr>
<td>Sand</td>
<td>2600 lbs.</td>
</tr>
<tr>
<td>Water</td>
<td>(approx.) 70 gals</td>
</tr>
</tbody>
</table>

The above quantities will give an approximate yield of one cubic yard. The flowability of the mixture shall be observed by the Engineer and
flowability increased / decreased by adjusting the water content as well as increasing/decreasing the air entraining admixture content.

Provide a mix design per TxDOT’s Specification Item 401 “Flowable Backfill”, Latest Edition.

434.4 Consistency. The consistency of the mix shall be tested by filling an open-ended 3 inch diameter cylinder 6 inches high, to the top with flowable fill. The cylinder shall be immediately pulled straight up and the correct consistency of the flowable fill shall produce a minimum 8 inch diameter circular type spread, with no segregation. The flowable fill shall maintain its consistency when placed.

434.5 Batching, Mixing, and Transportation. Materials are to be measured by weight. The flowable fill may be mixed in a central concrete mixer, a ready mix truck, or other means acceptable to the Engineer. The flowable fill shall be transported to the point of placement in a revolving drum mixer or in an agitator unit.

434.6 Placement. The flowable fill shall be placed by direct discharge from the mixer truck, or other approved methods. If necessary to prevent segregation, boots shall be used.

The flowable fill shall be placed in accordance with Item 430 "Construction of Underground Utilities" and Item 480 "Precast Reinforced Concrete Box Sewers". It will be necessary to use cement stabilized sand as bedding, as shown by the Standard Civil Drawing. At the option of the Engineer, the flowable fill may be used above the bedding to the uppermost elevation shown on the referenced drawings.

434.7 Measurement. No direct payment shall be made for flowable fill when used as backfill in accordance with Items 430 and 480, and the Standard Civil Drawings pertaining thereto.

Where used as backfill at other locations, and where measured, flowable fill shall be measured by the cubic yard, computed from the dry weight of the material.

434.8 Where measured for payment in accordance with Section 434.7 of this Item, flowable fill shall be paid for at the contract unit price bid per cubic yard, for flowable fill, which price shall be full payment for all materials, equipment, labor, and transportation necessary to complete the work.

There are line code(s), description(s), and unit(s), for this Item.
NOTE: This Item required other Standard Specifications
